

RFQQ 15-04
Addendum 3
Correction in Q&A Addendum 1

Washington Office of the Secretary of State, Washington State Library Division

In Q7 our answer to the question about the film used to produce master negatives we said it was acetate when it should read "polyester" film. Following is the full question and corrected answer:

Q7: Section 1.1 of RFQQ No. 15-04 indicates the preference to scan from film master negatives. There is no reference to the type, size, and mode of film used to produce the master negatives. What type(s) of film negatives will be the source images for this project? Thank you in advance for addressing this question for this RFQQ.

A7: Microfilm used for project will be 35mm negative masters typically used by libraries to preserve newspaper images. Reduction ratios will vary. Mostly the film is newer acetate polyester material.
